

## **Self Installation**

Many customers have the skills and expertise to install the backup sensors without professional assistance. Installation is very simple and only takes 1-2 hours total.

### **There are 3 main aspects of installation to understand:**

1. Drill holes in bumper. This is easy, we provide the drill bit that is perfectly fitted for the sensors.
2. Tap power from controller to the reverse back light. You need to identify which wire is the reverse back light and then you just tap into this wire.
3. Run speaker or LCD up to the front of the vehicle by hiding the wire underneath the carpet or corner panel.

These are the 3 main aspects of installation. If you believe that you can perform the installation, you will save \$75-150!!

Plus, you can call the MFG at anytime during business hours and they can walk you through the installation process.

## **Painting the Sensors**

RBS offers 2-3 different colored sensors. Black and unpainted is offered in most models, while white is offered with other models.

If you would like to get your sensors painted to match the exact color of your sensor, this is an option for you to consider. RBS recommends that you take the sensors to a professional body shop/collision center and typical costs for this is around \$10-15 per sensor.
