

Power has never been easier. **Superchips**

EASY-TO-USE

There is no easier way to improve your vehicle's performance than with a Superchips Tuner. You don't need any tools, not even a screwdriver! In fact, you don't even need to open the hood. It's almost a shame not to get your fingers dirty to achieve the powerful benefits of Superchips!

Why is it so easy? The Tuner plugs directly into the diagnostic port that is under the dash on most domestic cars and trucks. This connects the Tuner directly to the vehicle's ECU where it removes the factory settings and information and installs Superchips' dyno proven calibration. The factory setting is saved in the Tuner so you can easily return the vehicle to stock.

Without mechanical abilities, tools or computer knowledge you can still upgrade your vehicle's performance with a Superchips Tuner!

Both the Max MicroTuner™ and the FLASHPAQ™ plug right into the diagnostic port of the vehicle. This is the same port that dealerships use to access the vehicle's ECU and data.

Once connected, the Tuner will lead you through a variety of questions about your application and the different performance options available. It will also download and save the factory calibration so it can be reinstalled if ever desired.

When the new Superchips tune up is installed, simply unplug it from the diagnostic connector and fire up your engine for a test drive. You'll feel the performance improvements!
